PRELIMINARY AMENDMENT TO CLAIMS

Cancel claims 1-10, and add claims 11-13.

- 11. (New) A method of genotyping plants of the species *Triticum aestivum* and the genus *Triticeae* at a microsatellite locus, the method comprising
- a) amplifying chromosomal DNA with one or more oligonucleotide primer pairs specifically hybridizing to said locus of a region of said chromosomal DNA, wherein said region of the DNA comprises a repeated dinucleotide motif comprising at least one of the following selected from the group consisting of $(GA:CT)_n$, $(GT:CA)_n$, $(AT:TA)_n$, where $n \ge 10$, to obtain an amplification product,
- b) wherein each primer pair consists of a first oligonucleotide of SEQ ID NO. x and a second oligonucleotide of SEQ ID NO. x+1, and wherein x=1,3,5,7,9,11,13,15,17,19; and
- c) size fractionating the amplification product to provide a measure of the said motif of the chromosomal DNA between said primer pairs,

wherein the size of the amplification product is polymorphic for said locus and provides a marker for genotyping said plants.

- 12. (New) The method of claim 11, further comprising the step of using the resulting genotype for a further step chosen from the group consisting of DNA fingerprinting, species identification, relationship studies, similarity studies, characterization of cytological lines, and genetic mapping.
- 13. (New) The method of claim 11, further comprising one or more primer pairs, wherein said primer pairs have a first oligonucleotide of SEQ ID NO: x and a second oligonucleotide of SEQ ID NO: x + 1, and wherein x = 95, 111, 156, 293, 337, 369, 437, 493, 553, and/or 557.
